MANGROVE TREES IN MADAGASCAR

Reference No.
DE2754AC-1668

Planting: A mix of four different mangrove species are planted as well as at least 10% agroforestry trees to provide an additional source of income to the local people.

Mangroves are an excellent forest type for restoration- it not only stores more carbon than traditional forests, it also provides multiple benefits to coastal communities like storm protection, water filtration and livelihood generation. Each mangrove tree removes around 308kg of CO2 from the atmosphere over the course of its life-cycle (approximately 25 years).

A handwritten signature in green ink that reads 'N. Blake'.
